

Test  
Dec. 13  
Wednesday

# Warm Up

$$y = mx + b$$

1) Write an equation for the line :

2) Write an equation of a line that passes through  $(-7, 4)$  and  $(-5, 10)$  and has a y intercept of  $-5$ .

$$m = \frac{y_2 - y_1}{x_2 - x_1}$$

$$= \frac{(10) - (4)}{(-5) - (-7)}$$

$$= \frac{6}{2}$$

$$m = 3$$

$$b = -5$$

$$y = mx + b$$

$$y = 3x - 5$$

3) Given the equations

$$y = \frac{2}{5}x + 6$$

$$y = mx + b$$

↑ slope  
↘ y-intercept

- i) Slope  $\frac{2}{5}$
- ii) y-intercept = 6
- iii) x-intercept

x-intercept Let  $y = 0$

$$y = \frac{2}{5}x + 6$$

$$0 = \frac{2}{5}x + 6$$

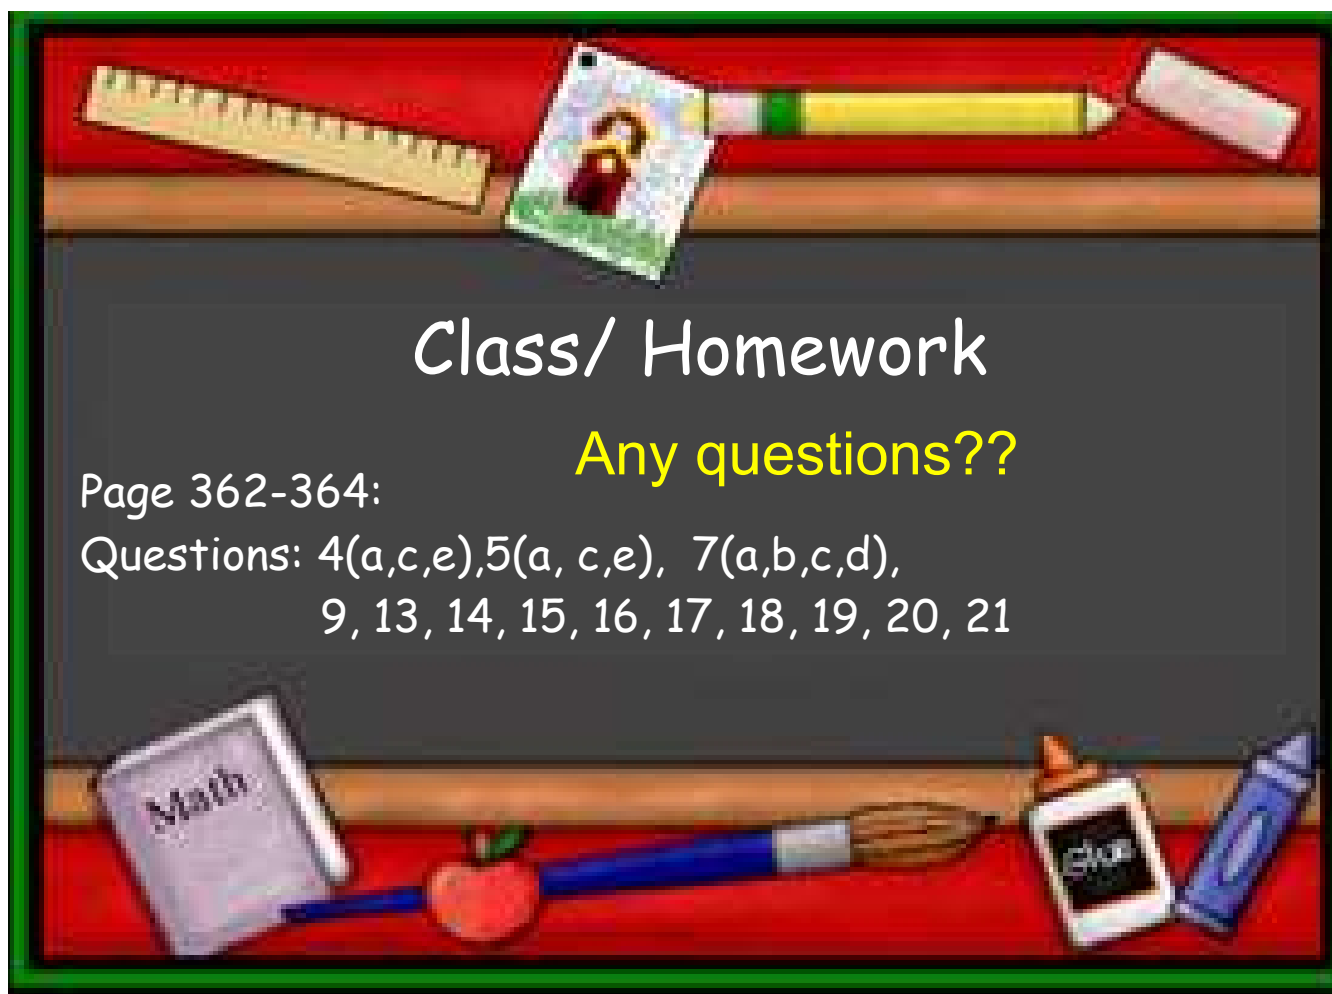

$$-6 = \frac{2}{5}x$$

$$(-5) \cdot -6 = \frac{2}{5}x \cdot (-5)$$

$$-30 = 2x$$

$$\frac{-30}{2} = \frac{2x}{2}$$

$$-15 = x$$

Class/ Homework

Any questions??

Page 362-364:

Questions: 4(a,c,e), 5(a, c,e), 7(a,b,c,d),  
9, 13, 14, 15, 16, 17, 18, 19, 20, 21

Can you rearrange this to slope intercept form?

$$y = mx + b$$

↑ slope
 ← y intercept

a)  $2y = -3x - 10$

$$\frac{2y}{2} = \frac{-3x}{2} - \frac{10}{2}$$

$$y = -\frac{3}{2}x - 5$$

$$m = -\frac{3}{2} \quad b = -5$$

b)  $(3y) + 4 = 2x + 5$

$$3y + \cancel{4-4} = 2x + \underbrace{5-4}$$

$$3y = 2x + 1$$

$$\frac{3y}{3} = \frac{2x}{3} + \frac{1}{3}$$

$$y = \frac{2}{3}x + \frac{1}{3}$$

$$m = \frac{2}{3} \quad b = \frac{1}{3}$$

$$y = mx + b$$

↑ slope
 ← y intercept

$$y = mx + b$$

You need a

**Slope (m)**

**y-intercept (b)**

$$(x_2 - x_1) m = \frac{(y_2) - (y_1)}{\cancel{(x_2) - (x_1)}} \quad [\cancel{x_2 - x_1}]$$

$$y_2 - y_1 = m(x_2 - x_1)$$

## Point - Slope Form

You can also find the equation of a line if you are given a point and the slope of the line. In order to do this you use the formula:

You need a <sup>Need</sup> **-Point & a Slope**  
*(x<sub>1</sub>, y<sub>1</sub>)*      *m*

$$y - y_1 = m(x - x_1)$$

The **x** and **y** values from the given point

This equation can be rearranged

to  $y = mx + b$

(slope intercept)

$$y - y_1 = m (x - x_1)$$

Slope point form is a rearrangement of

$$m = \frac{y - y_1}{x - x_1}$$

$$\overbrace{m}^{\quad} = \frac{(y - y_1)}{\underbrace{(x - x_1)}_{\quad}}$$

$$\cancel{(x - x_1)} \cdot \overbrace{m}^{\quad} = \frac{(y - y_1)}{\cancel{(x - x_1)}} \cdot \cancel{(x - x_1)}$$

$$m (x - x_1) = y - y_1$$

**Example 1:**

Find the equation of a line that passes through  $(-3,4)$  and has the same slope as  $y = 3x + 2$ .

↓  
m

Write what you know:

$$m = 3 \quad \begin{matrix} x_1 & y_1 \\ (-3, 4) \end{matrix}$$

$$y - y_1 = m(x - x_1)$$

$$y - 4 = 3(x - (-3))$$

$$y - 4 = 3(x + 3)$$

Fix signs

$$y - 4 = 3x + 9$$

multiply through bracket

first get to

**Point Slope Form**

$$y - \cancel{4} + 4 = 3x + 9 + 4$$

$$y = 3x + 13$$

↑  
m

↑  
y-intercept

then continue to rearrange to get to

**Slope Intercept Form**

Find the equation of the line if it has a slope of -3 and it goes through the point (1,7)

$$\begin{aligned} & m = -3 \quad (1, 7) \\ & y - y_1 = m(x - x_1) \\ & y - 7 = -3(x - 1) \\ & y - 7 = -3x + 3 \\ & y - \cancel{7} + 7 = -3x + \underbrace{3 + 7} \\ & y = -3x + 10 \\ & \quad \quad \quad \uparrow \quad \quad \quad \underbrace{\hspace{2cm}} \\ & \quad \quad \quad m \quad \quad \quad \text{y-intercept } b \end{aligned}$$

Leave in point slope form

Given  $y - 3 = \frac{-2}{5}(x+4)$  determine the slope and a point on the line

$$y - (y_1) = m(x - x_1)$$
$$y - 3 = -\frac{2}{5}(x + 4)$$

← point  
slope

$$m = -\frac{2}{5} \quad \left( \overset{x}{-4}, \overset{y}{3} \right)$$

Point  $(x, y)$   
 Slope  $m \rightarrow y - y_1 = m(x - x_1)$

$y = mx + b$   
 slope  
 intercept
