

Logan C

### Structural adaptation

The long finned eel can change color, they have a countershaded fresh water phase and a silvery oceanic phase.

The snowshoe hare changes color in the summer and the winter, they have brown fur in the summer and white fur in the winter.

### Physiological adaptations

The king cobra is a venomous snake, they emit enough venom in one bite to kill 20 people.

The death stalker scorpion is one of the most toxic scorpions, they look strong but they are actually really weak and they have to attack very wisely

#### Behavioural adaptations

Geese migrate in the winter because they can't survive the cold of the winter.

Groundhogs hibernate during the winter and they wake up halfway through (Feb 2) to see how much it will last and this depends on if he sees his shadow or not.
