

SUSTAINABILITY IN ACTION

Use experiential learning skills to investigate your schools carbon footprint

This multi-visit (3-5 weeks) program allows students to come up with their own sustainability questions about water, waste, food, transport or energy in their school. We will help throughout the entire process from launching the project, collecting data and final presentations. We focus on the importance of the Scientific Method, emphasizing data collection/ interpretation and how to relate findings to real world examples. Let's find out just how much money your school could be saving on its energy bill.

Examples of past projects:

The students choose their area of study!

- Switching lighting to LED
- Vermiculture composting
- Improving waste footprint
- Investigating bus routes
- Water savings from efficient toilets
