Independent Variable

- Hours do not depend on the person's pay.

- A person's pay often depends on the number of hours worked.

FUNCTIONS

Relations VS Functions

- a **relation** is where a pattern/relationship exists between the independent variable (x) and the dependent variable (y).

- a **function** is a special relationship where...
"each x has one and only one y value".

Function or Nonfunction

Function:

A relation where each element in the first set is associated with one and only one element in the second set.

Functions

- How can I tell from a set of points/table?
 - a function is a relation in which no two ordered pairs have the same first coordinate.
(a function CANNOT have x repeated)

If x is repeated then it is a NON-function

Arrow Diagrams

Function:

For every first element there is one and only one second element. (Only one arrow starts from each element of the domain.)

Function or Nonfunction

** To determine whether or not a graph is a function or nonfunction, we use what is called the vertical line test!!

** If the line crosses the graph more than once at any particular location, then it is not a function.

Nonfunction

**** State whether the graph is a function or nonfunction, as well as stating the domain & range!!**
