

STARS

Stars are large balls of gas that are on fire.

The closest Star to Earth or any other planet is the sun.

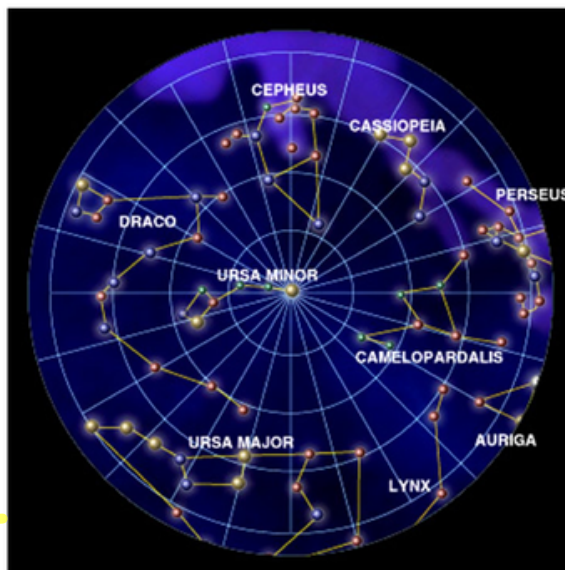

Luminous

Stars are very far away and that is why they appear so small.

For instance a rocket that travels 1000 miles an hour would take 450 years to reach the sun just from Pluto.

Constellations

- ✦ Constellations group of stars that form a pattern in the sky
- ✦ The shapes you see all depend on your point of view.
- ✦ Stars in a constellation are NOT close to each other, but when viewed from Earth they seem to be grouped together

* Usually named after animals or made up characters.
