

# Physics 112

Wednesday Nov 22<sup>nd</sup>

So far,

Momentum  $\longrightarrow p = mv$

Conservation of momentum  $\longrightarrow$  Before momentum = After momentum

W  $\longrightarrow W = \vec{F}d$        $W = \Delta KE$

Power  $\longrightarrow P = \frac{W}{t}$

KE  $\longrightarrow KE = \frac{1}{2}mv^2$

PE  $\longrightarrow PE = mgh$

Energy

$$KE = \frac{1}{2}mv^2$$

Energy due to an object moving.

$$PE = mgh$$

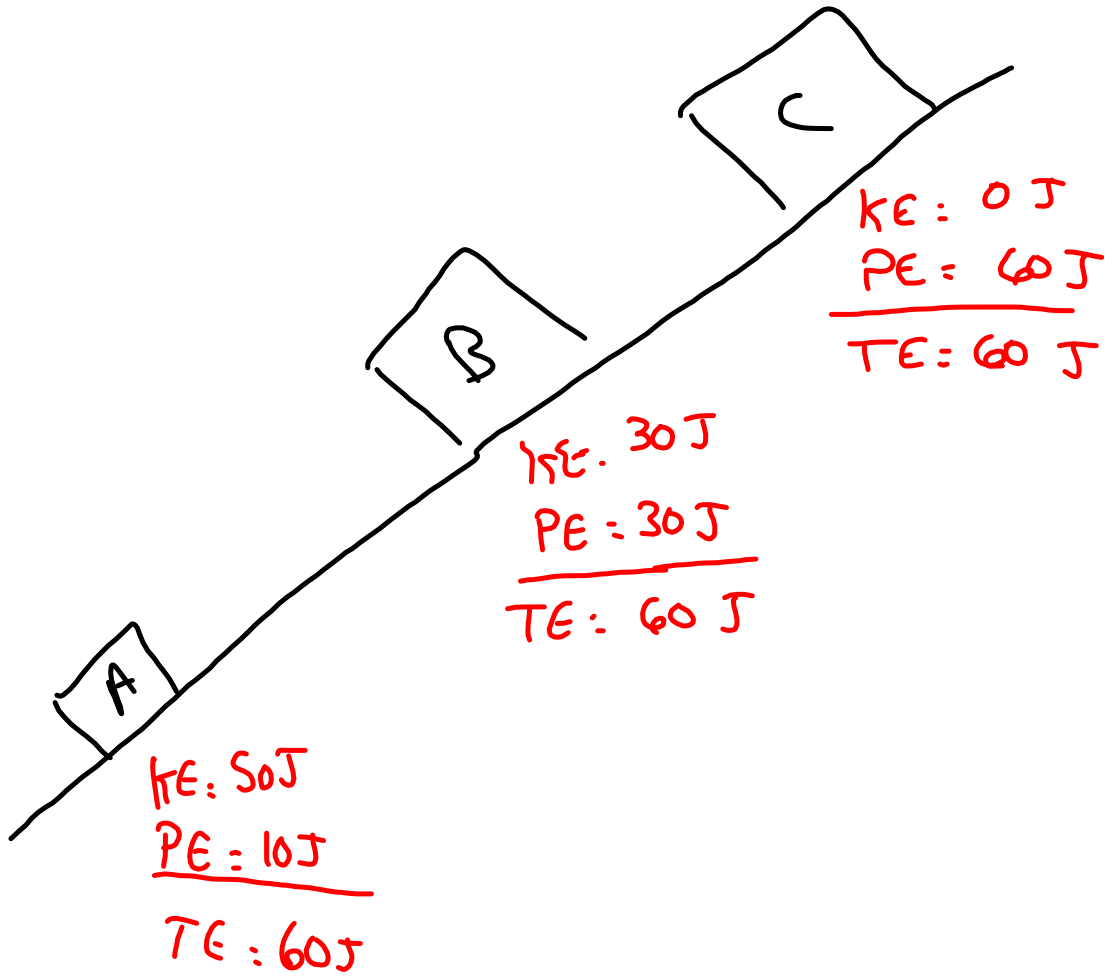

Energy due to an object's height.  
- Stored energy.

## Conservation of Energy

As an object moves  
the combination of its  
KE and PE remain constant.

$$TE = KE + PE$$

If you can calculate both the KE  
and the PE at any point along an  
object's path, the addition  
of these two is the TE at  
that position. This value for TE  
will remain constant along  
its path.

Example i

Start

$$h = 0 \text{ m}$$

$$\begin{aligned}
 PE &= mgh \\
 &= 10(9.81)0 \\
 &= 0 \text{ J}
 \end{aligned}$$

$$v = 10 \text{ m/s}$$

$$\begin{aligned}
 KE &= \frac{1}{2}mv^2 \\
 &= \frac{1}{2}(10)(10)^2 \\
 &= 500 \text{ J}
 \end{aligned}$$

$$\begin{aligned}
 TE &= PE + KE \\
 &= 0 + 500 \text{ J}
 \end{aligned}$$

$$TE = 500 \text{ J}$$

Top

$$TE = 500 \text{ J}$$

$$\begin{aligned}
 KE &= \frac{1}{2}mv^2 \\
 &= \frac{1}{2}(10)(2)^2 \\
 &= 20 \text{ J}
 \end{aligned}$$

$$TE = PE + KE$$

$$TE - KE = PE$$

$$500 \text{ J} - 20 \text{ J} = 480 \text{ J} = PE$$

$$PE = mgh$$

$$480 = 10(9.81)h$$

$$4.9 \text{ m} = h$$

Example # 2

Start

$$h = 0 \text{ m}$$

$$\begin{aligned} PE &= mgh \\ &= 5(9.8)(0) \\ &= 0 \text{ J} \end{aligned}$$

$$\begin{aligned} KE &= \frac{1}{2}mv^2 \\ &= \frac{1}{2}(5)(10)^2 \\ &= 250 \text{ J} \end{aligned}$$

$$\begin{aligned} TE &= PE + KE \\ &= 0 + 250 \text{ J} \end{aligned}$$

$$TE = 250 \text{ J}$$

End

$$TE = 250 \text{ J}$$

$$\begin{aligned} PE &= mgh \\ &= 5(9.8)(3) \\ &= 147 \text{ J} \end{aligned}$$

---

$$TE = KE + PE$$

$$250 = KE + 147 \text{ J}$$

$$103 \text{ J} = KE$$

$$KE = \frac{1}{2}mv^2$$

$$103 = \frac{1}{2}(5)v^2$$

$$206 = 5v^2$$

$$41.2 = v^2$$

$$6.4 \text{ m/s} = v$$

How can we identify a problem as a total energy (TE) problem?

Ans: Look to see if there are both differences in:

- (a) height
- (b) velocity.

→ Try Model problem p 285  
from the green text.

→ p 287 (1, 2, 3)  
use  $m = 95 \text{ kg}$

1. Start

$$\begin{aligned}
 KE &= \frac{1}{2}mv^2 \\
 &= \frac{1}{2}(95)(4)^2 \\
 &= 760 \text{ J}
 \end{aligned}$$

$$\begin{aligned}
 PE &= mgh \\
 &= 95(9.81)(12) \\
 &= 11183
 \end{aligned}$$

$$\begin{aligned}
 TE &= KE + PE \\
 &= 760 + 11183 \\
 &= 11943.4
 \end{aligned}$$

$$\begin{aligned}
 &\underline{A} \\
 PE &= mgh \\
 &= 95(9.81)4 \\
 &= 3727.8 \text{ J} \\
 TE &= 11943.4 \text{ J} \\
 \hline
 KE &= TE - PE \\
 &= 11943.4 - 3727.8 \\
 &= 8215.6 \text{ J}
 \end{aligned}$$

$$\begin{aligned}
 KE &= \frac{1}{2}mv^2 \\
 8215.6 &= \frac{1}{2}(95)v^2
 \end{aligned}$$

$$173 = v^2$$

$$\boxed{13.2 = v \text{ m/s}}$$
